

What we have completed

A plain-language update on Falco system improvements

Dear Falco leadership,

This note explains the improvements already delivered in the Falco Loan Management System, based on the requested system changes document. It is written for business owners and managers — not for software engineers.

In short: staff can now capture better customer and guarantor information, work faster with clearer screens and downloads, and handle payments with fewer mistakes. Some larger reports and new finance modules still need backend (server) support before they can go live.

At a glance

- Customer & guarantor registration is stronger and more complete
- Loan calculator can be downloaded as PDF or Excel
- Payments are clearer (labels explain Principal / Interest / Fees)
- Several leadership reports and new modules are still planned next

1. Customers & registration — clearer, fuller records

When registering or editing a customer, staff can now:

Improvement	What this means for Falco
Larger passport / profile photo	Customer photos are bigger and easier to recognise on the profile screen — less need to zoom in.
Several phone numbers	A customer can have many alternative numbers (not only one or two), so officers can still reach them.
Different ID types	Staff can choose National ID, voter ID, driving licence, or passport — not only National ID.
Map location tools	Staff can place the customer on a map or search an area, instead of typing coordinates only.
Faster photo loading	Photos open more smoothly using a quick preview, so screens feel snappier.

2. Guarantors — more complete protection for each loan

Guarantors are people who stand behind a borrower. The system now captures more of what the business asked for:

Improvement	What this means for Falco
Passport-style photo	Each guarantor has a circular photo upload, same idea as a customer passport photo — easy to recognise later.
Sex / gender recorded	Guarantor sex is captured as part of registration.
More than one guarantor	Staff are no longer limited to a single guarantor — they can add as many as needed.
Guarantor collateral photos	Photos of items pledged by a guarantor can be uploaded freely (no tight limit).

3. Groups (Vikundi) — fairer loan applications per member

For group lending, each member can apply for their own loan amount through the group page. That matches real field practice: members in the same group often need different loan sizes. Group outstanding totals are also easier to see.

4. Day-to-day tools staff use every day

Improvement	What this means for Falco
Loan calculator downloads	After calculating a loan, staff can download a PDF or Excel file of the result and repayment schedule — useful for printing, sharing, or filing.
Clearer payment breakdown	On the payments screen, short codes P, I, and F show a tip when you hover: Principal, Interest, and Fees. New staff understand allocations faster.
Safer payment reversal	Reversing a payment asks for confirmation and a reason, reducing accidental reversals.
Lead tracking basics	Lead reports can show gender and which staff member added the lead — helpful for performance follow-up.
Portfolio risk ageing	PAR / ageing views help management see how late loans are distributed by days overdue.
Loan progress bars	Active loans show a visual progress bar for how much has been paid, not only a percentage in text.

5. Business value in simple terms

These changes help Falco in three practical ways:

Better information — Officers capture phones, IDs, guarantor photos, and collateral evidence that credit and collections teams need later.

Fewer mistakes — Clearer payment labels, confirmation before reversing money, and downloadable calculator results reduce confusion.

Faster fieldwork — Larger photos, quicker image loading, and group member loan apply make daily registration and group work smoother.

6. What is still coming next

Some requests from the original improvement list are not finished yet. Many of those need new work on the system's server side (the "backend") before the screens can show them. Important examples:

- Advanced lead performance dashboards (conversion rates, stale leads, lost-lead reasons)
- Customer demographic reports (by sex, age group, region, economic activity)
- Branch targets, cash/vault tracking, and disbursement turnaround-time reports
- Group meeting attendance and group-level risk badges
- Importing ClickPesa / bank statements for reconciliation, and batch approve tools
- New modules for other income, expenses, and non-client payments

A separate technical brief has already been prepared for the backend developer so those remaining items can be scheduled in clear waves.

7. Closing note

The system is already more useful for onboarding customers and guarantors, supporting group lending, explaining payments, and sharing loan calculations. The next phase focuses on management reports, branch controls, and finance modules that need deeper server support.

If you would like a live walkthrough of the completed screens (customer registration, guarantors, calculator download, and payments), the team can arrange a short demonstration.
